Abstract

In a method for operating a field device, which is connected by way of a data bus D with a control system L, by means of a graphical user interface and a device description file for a field device e.g. F1, F2, F3, the device description file includes two components, a data component and a presentation component, which are loaded together dynamically at run time into a browser. Because the data component and the presentation component are produced together as a device description file, the presentation component can be matched exactly to the functionality of the field device. In this way, the operation of a field device e.g. F1, F2, F3 is considerably simplified.
